

[illegible]

The first step in the process of identifying the appropriate level of care for a patient is to determine the patient's current level of functioning. This involves assessing the patient's physical, mental, and social status. The second step is to identify the patient's needs and goals. This involves understanding the patient's values, beliefs, and preferences. The third step is to develop a plan of care that addresses the patient's needs and goals. This involves selecting appropriate interventions and services. The fourth step is to implement the plan of care. This involves coordinating the various services and interventions. The fifth step is to evaluate the patient's progress. This involves monitoring the patient's response to the interventions and making adjustments as needed.
